

CLAIMS

1. Apparatus comprising:

a connector that bounds a channel that is capable of being coupled in fluid communication to a fluid source;

a nozzle attached to the connector in fluid communication with the channel to receive fluid from the channel and spray it outwardly from the channel; and

an exterior facet of the connector that is capable of being borne against a surface to locate the nozzle.

2. Apparatus of claim 1, wherein the nozzle is located at the facet.

3. Apparatus of claim 1, wherein the facet is disposed apart from the nozzle.

4. Apparatus of claim 1, further including an engagement assembly attaching the nozzle to the connector comprising:

an engagement element carried by one of the nozzle and the connector; and

a detachably engaged complementary engagement element carried by the other of the nozzle and the connector.

5. Apparatus of claim 4, wherein the engagement element comprises one of a threaded element and a complementary threaded element.

6. Apparatus of claim 5, wherein the complementary engagement element comprises the other of the threaded element and the complementary threaded element.

7. Apparatus of claim 1, wherein the channel comprises an intermediate passage that communicates with opposing counterbores that are each capable of attaching a fluid conducting conduit.

8. Apparatus comprising:

a connector having opposing ends;

a channel bound by the connector and capable of being coupled in fluid communication to a fluid source;

a nozzle attached to the connector between the opposing ends in fluid communication with the channel to receive fluid from the channel and spray it outwardly from the channel; and

adjacent exterior facets of the connector that extend longitudinally of the connector from one of the opposing ends to the other of the opposing ends.

9. Apparatus of claim 8, wherein the nozzle is located at one of the facets.

10. Apparatus of claim 8, wherein the facets are disposed apart from the nozzle.

11. Apparatus of claim 8, further including an engagement assembly attaching the nozzle to the connector comprising:

an engagement element carried by one of the nozzle and the connector; and

a detachably engaged complementary engagement element carried by the other of the nozzle and the connector.

12. Apparatus of claim 11, wherein the engagement element comprises one of a threaded element and a complementary threaded element.

13. Apparatus of claim 12, wherein the complementary engagement element comprises the other of the threaded element and the complementary threaded element.

14. Apparatus of claim 8, wherein the channel comprises an intermediate passage that communicates with opposing counterbores disposed at the opposing ends that are each capable of attaching a fluid conducting conduit.

15. Apparatus comprising:

a connector having an attached nozzle and opposing ends, the connector capable of receiving fluid and conducting it to the nozzle and the nozzle capable of receiving fluid from the connector and spraying it outwardly therefrom; and

facets carried by the connector that extend longitudinally of the connector from one of the opposing ends to the other of the opposing ends, each of the facets capable of being borne against a surface to locate the nozzle.

16. Apparatus of claim 15, wherein the nozzle is located at one of the facets.

17. Apparatus of claim 15, wherein the facet is disposed apart from the facets.

18. Apparatus of claim 15 further including an engagement assembly attaching the nozzle to the connector comprising:

an engagement element carried by one of the nozzle and the connector; and

a detachably engaged complementary engagement element carried by the other of the nozzle and the connector.

19. Apparatus of claim 18, wherein the engagement element comprises one of a threaded element and a complementary threaded element.

20. Apparatus of claim 19, wherein the complementary engagement element comprises the other of the threaded element and the complementary threaded element.

21. Apparatus of claim 15, wherein the channel comprises an intermediate passage that communicates with opposing counterbores that are each capable of attaching a fluid conducting conduit.
